一、 程式摘要

1. 邏輯/原理

求「Minimum Spanning Tree」,我們分別以下列兩種演算法實作。

✓ Kruskal

以蒐集 edge 的方是找出最小 weight 且不形成 cycle 的情况下來建立 MST。首先建立 edge 與 vertex 的 set,前者儲存所有 edge 及其 weigth,後者儲存各個 vertex 的 parent 及 child 關係。我們需先將 edge set 依 weight 由小到大排序,再從 edge set 中一一取出兩端的 vertex,利用 FIND_ROOT_VERTEX method 去判斷兩 vertex 是否屬於同一個 set 以及有無 cycle 存在,如果不是則可加入 MST 中,並利用 UNION_VERTEX method 將兩 vertex 合併 為一個新 set,接著再從 edge set 中的取出下一條 edge 重複步驟,最後即可形成 MST。

✓ Prim

先建立幾組 set (edge:儲存所有 edge 及其 weight; parent:儲存各個 vertex 的 parent 及 child 關係; key: edge 的 weight,但會存在 vertex 上,表示到達該 vertex 的成本; visited 的表示是否已在 MST 中)。決定起始 vertex u,找出與 u 相連 edge 之 weight,判斷從 u 經由 edge 到達 v 需要多少成本,若成本小於原 key[v]中的成本,則更新 key[v],同時也代表 兩 vertex 可以有一個 parent and child 的關係,因此也記錄到 parent set 中;之後再利用 EXTRACT_MIN method 選出 key set 中值最小的 vertex 放入 MST,並重複前述步驟,找出 與此 vertex 相連的所有 edge 做判斷,以此概念逐漸向外擴張,最終即可蒐集完 MST。

2. 語言

兩種方式皆以 C 語言實作。

二、 程式內容說明

1. 程式註解

✓ Kruskal

```
#include <stdio.h>
#include <stdlib.h>

// 宣告常數
#define MAX_VERTICES_NUMBER 1000
#define MAX_EDGES_NUMBER 10000

// 裝填 edge 相關屬性的結構
// 包含兩個 vertex 及其權重
```

```
struct edge {
   int vertex_one;
